
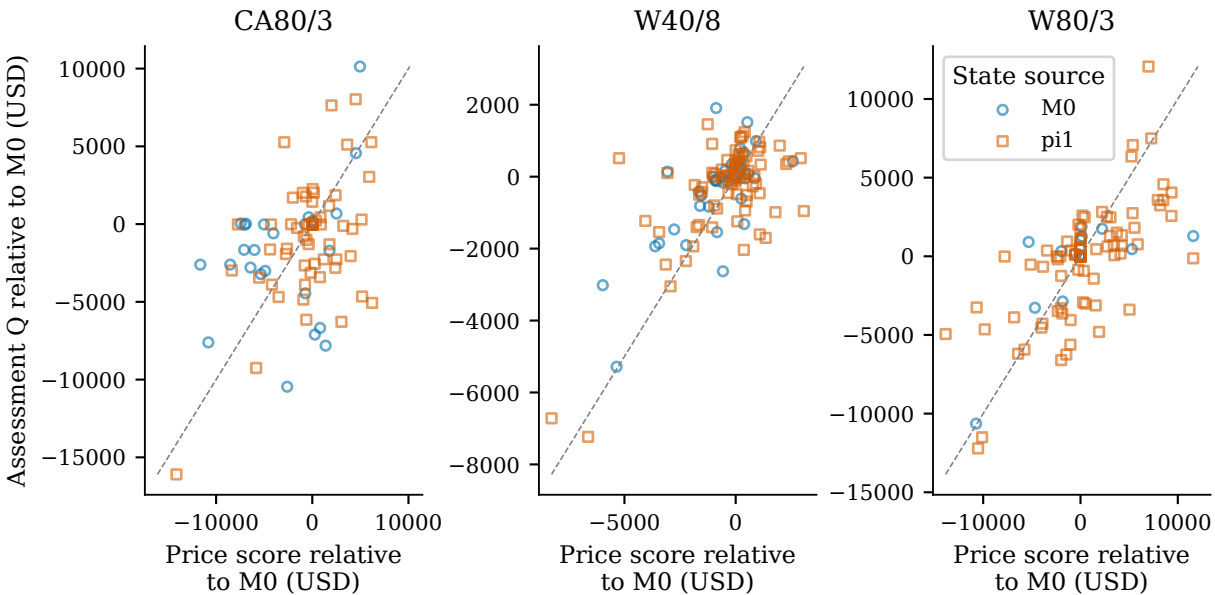
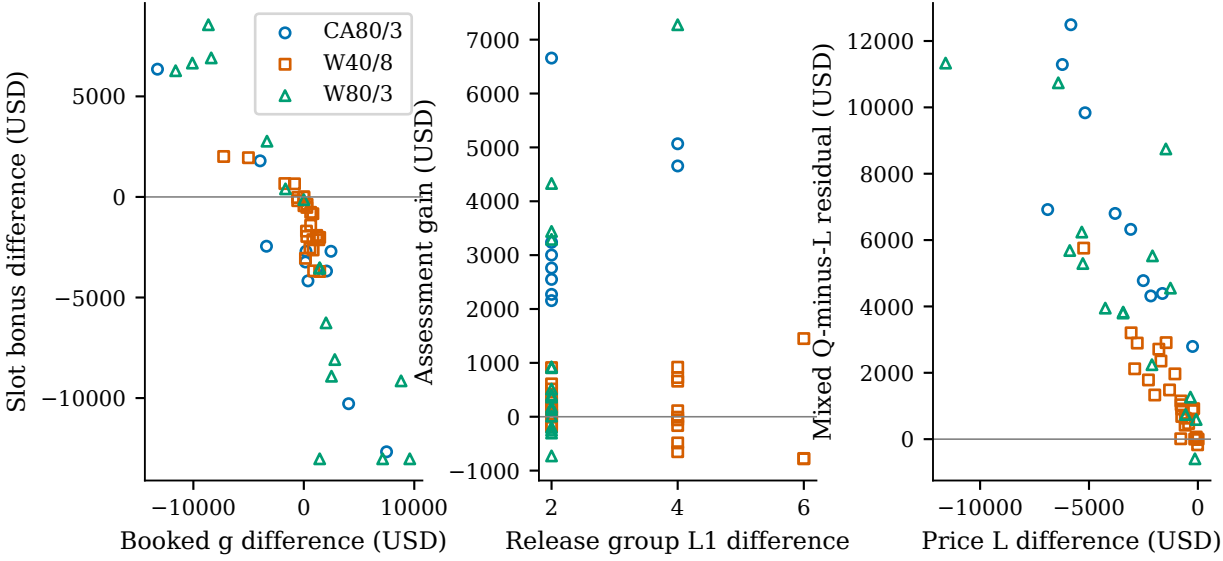
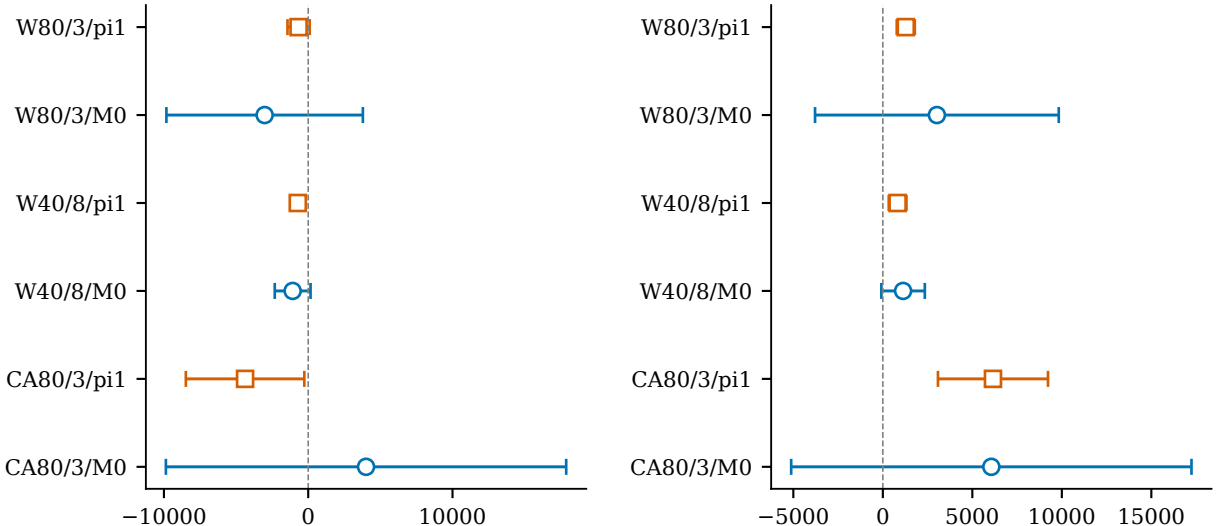
40 scenarios per row; paired unadjusted t95 intervals. Six-test Holm p values reported separately.



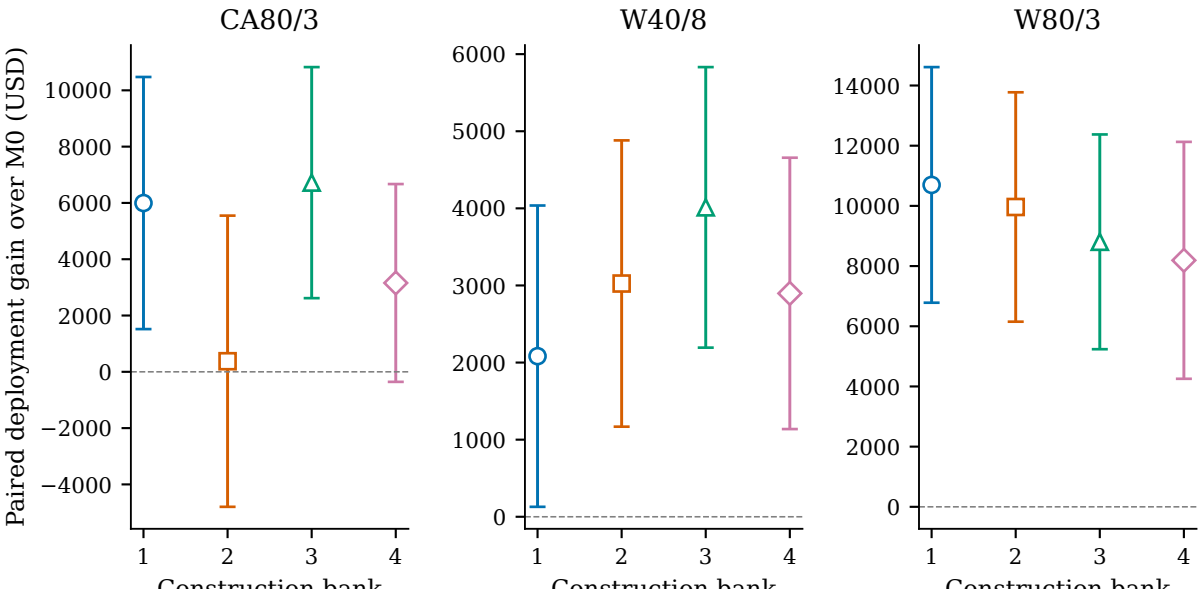
Frozen candidate subset; point rankings contain MC error. Reporting L excludes the explicit solver tie-break.



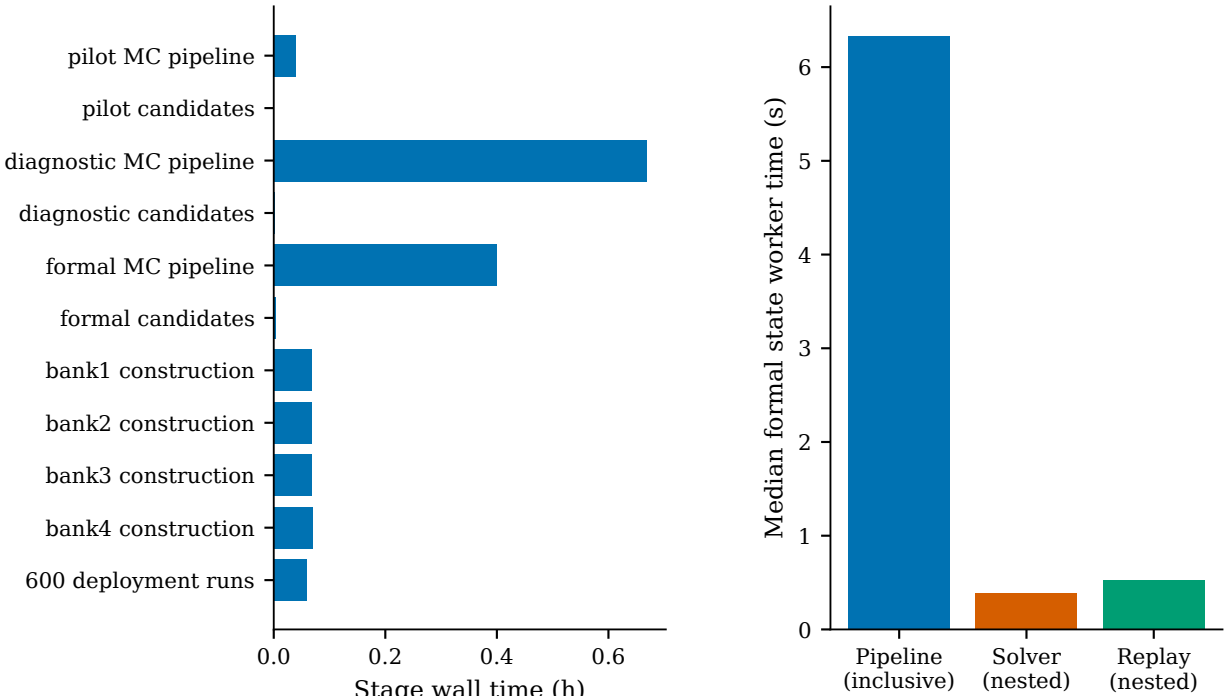
All formal release-divergent pairs retained; no profit-based case selection. Residual is not pure nonseparability.



Scenario averages of eligible preselected current-free-resource pairs; unadjusted t95. Cross-time injection not implemented.



Each bank: 60 construction scenarios and the SAME 40 deployment scenarios. Conditional t95; four banks are descriptive, not n=160.



MC is offline diagnostic, NOT a real-time latency claim. Inclusive pipeline, solver and replay must not be added together.
